Executive Summary

In March 2007 CSU-Monterey Bay began hydrologic monitoring of Santa Lucia Preserve for the Santa Lucia Conservancy. This project is a continuation of monitoring begun by Balance Hydrologics as part of the permit requirements for land development. The purpose of this annual report is to present precipitation and streamflow summaries for the 2014 water year (October 1, 2013 to September 30, 2014) for Potrero and San Clemente Creeks. Daily records of discharge, temperature, and specific conductance are reported. Daily precipitation values are reported from two locations, the San Clemente Dam and Santa Lucia Preserve golf course.

Water Year 2014 produced 10.61 inches of rainfall at the San Clemente Dam representing a drought with a 22 year recurrence interval. Flow in both creeks was very low, yielding between 0.02 and 0.03 acre-ft/acre of watershed. Flow at the Potrero Creek gage ceased on July 24, whereas San Clemente Creek maintained baseflow throughout the year.

This report can be cited as:

1 Introduction

This report is a hydrologic data summary for Santa Lucia Preserve for Water Year 2014 (WY-14). Balance Hydrologics installed four continuously recording streamflow gages on Santa Lucia Preserve. These gages include two on Las Garzas Creek (Moore's Lake inflow and outflow, installed in 2001), two on Potrero Creek (one installed in 2002 and one installed in 2013), and one on San Clemente Creek (installed in 2012). Detailed information on gage installation, operation and individual gage sites is available in Balance Hydrologics (2002).

Operation of the Potrero Creek and San Clemente Creek streamflow gages was transferred to CSUMB Watershed Institute on June 21, 2007. Data summaries are presented for streamflow on Potrero and San Clemente Creeks and for precipitation on Santa Lucia Preserve and San Clemente Dam.

2 Precipitation Data

Precipitation data from the Santa Lucia golf course is from a Rain Bird weather station operated by Santa Lucia Preserve. Precipitation data recorded by California American Water Company at nearby San Clemente Dam are included for comparison.

At San Clemente Dam the total WY-14 rainfall was 10.61 inches (Table 1 and Figure 1), which represents below average precipitation at the Dam. Based on the 92-year San Clemente Dam precipitation record, the average rainfall is 21.20 inches. Using Log-Pearson Type-III analysis, rainfall at San Clemente Dam should be less than 10.61 once in every 22 years on average (Figure 2).

The recorded rainfall at the Santa Lucia Preserve Golf Course in WY-14 was 15.10 inches (Table 2 and Figure 3), which is below the 13 year average of 25.70 inches. The short duration of the record at the golf course may not produce an average value that is representative of actual long term precipitation patterns. The Preserve golf course received approximately 4.5 more inches of rain than the nearby San Clemente Dam. The available data do not show a consistent relationship between total precipitation at the San Clemente Dam and total precipitation at the golf course. During the 13 years of rain gage operation at the golf course, the golf course gage has recorded between 0.96 fewer inches

and 12.10 more inches than the Dam gage, with an average difference of 6.60 inches and a standard deviation of 4.17 inches.

3 Streamflow, Temperature, and Conductance Data

The streamflow gaging station on Potrero consists of a Campbell CR10X data logger and a level TROLL 500. The stream flow gaging station on San Clemente consists of a Campbell CR1000 data logger (powered by 10 or 20 watt solar panels) and two Druck pressure transducers to measure water depth. Both Campbell data loggers have a specific conductance and water temperature probe, as well as staff plates for manual readings (Balance Hydrologics 2002). The Campbell data loggers record measurements of pressure, temperature, and conductance at 15-minute intervals. The level TROLL 500 data logger records measurements of pressure and temperature at 5-minute intervals.

In WY-14, streamflow gage data were downloaded to a laptop computer during monthly visits, at which time manual discharge measurements were also taken using standard hydrologic practices. A FlowTracker (SonTek handheld ADV) current velocity meter was used to measure discharge. A portable three-inch Parshall flume was used to measure discharge during the latter part of the dry season when flows became too low to use the FlowTracker meter.

3.1 Potrero Creek

The current gage station on Potrero Creek was installed April 29, 2002 and is located upstream of the T-11 well. In WY-14, Potrero Creek had a mean daily flow of 0.18 cfs, a maximum daily flow of 7.3 cfs, and a minimum daily flow of 0.00 cfs; the 7-day low flow was 0.00 cfs (Table 3). Mean daily streamflow and manual discharge measurements are plotted in Figure 4. Temperature and conductance data are presented in Tables 4 through 7, and in Figure 5.

3.2 San Clemente Creek

The current gage station on San Clemente Creek was installed January 17, 2012 and is located near the Santa Lucia Preserve property boundary. In WY-14, San Clemente Creek had a mean daily flow of 0.08 cfs, a maximum daily flow of 2.0 cfs, and a minimum daily flow of less than 0.01 cfs; the 7-day low flow was less than 0.01 cfs (Table 8). Mean daily streamflow and manual discharge measurements are plotted in Figure 6. Temperature and conductance data are presented in Tables 9 through 12, and in Figure 7.

4 Limitations

Streamflow gage data are based on the stage-discharge relationship unique to each stream and gage location. This stage-discharge relationship (rating curve) for each gage has been developed over time by making manual discharge measurements at various ranges of flow and noting the water level (stage) at which a particular flow occurs. Both rating curves include historic high flow measurements. The rating curve for San Clemente Creek was not adjusted this year. The rating curve for Potrero Creek was adjusted this year to reflect to changes in the channel.

As more discharge measurements are made (particularly in the higher range of flows) the rating curves may change and it will be necessary to update the streamflow data to reflect these changes. For this reason, the streamflow data contained in this report should be considered provisional and caution should be exercised when using these data.

Discharge values were only reported beginning in mid-November for the Potrero Creek gage due to a malfunction that began February 1, 2013.

7 Figures

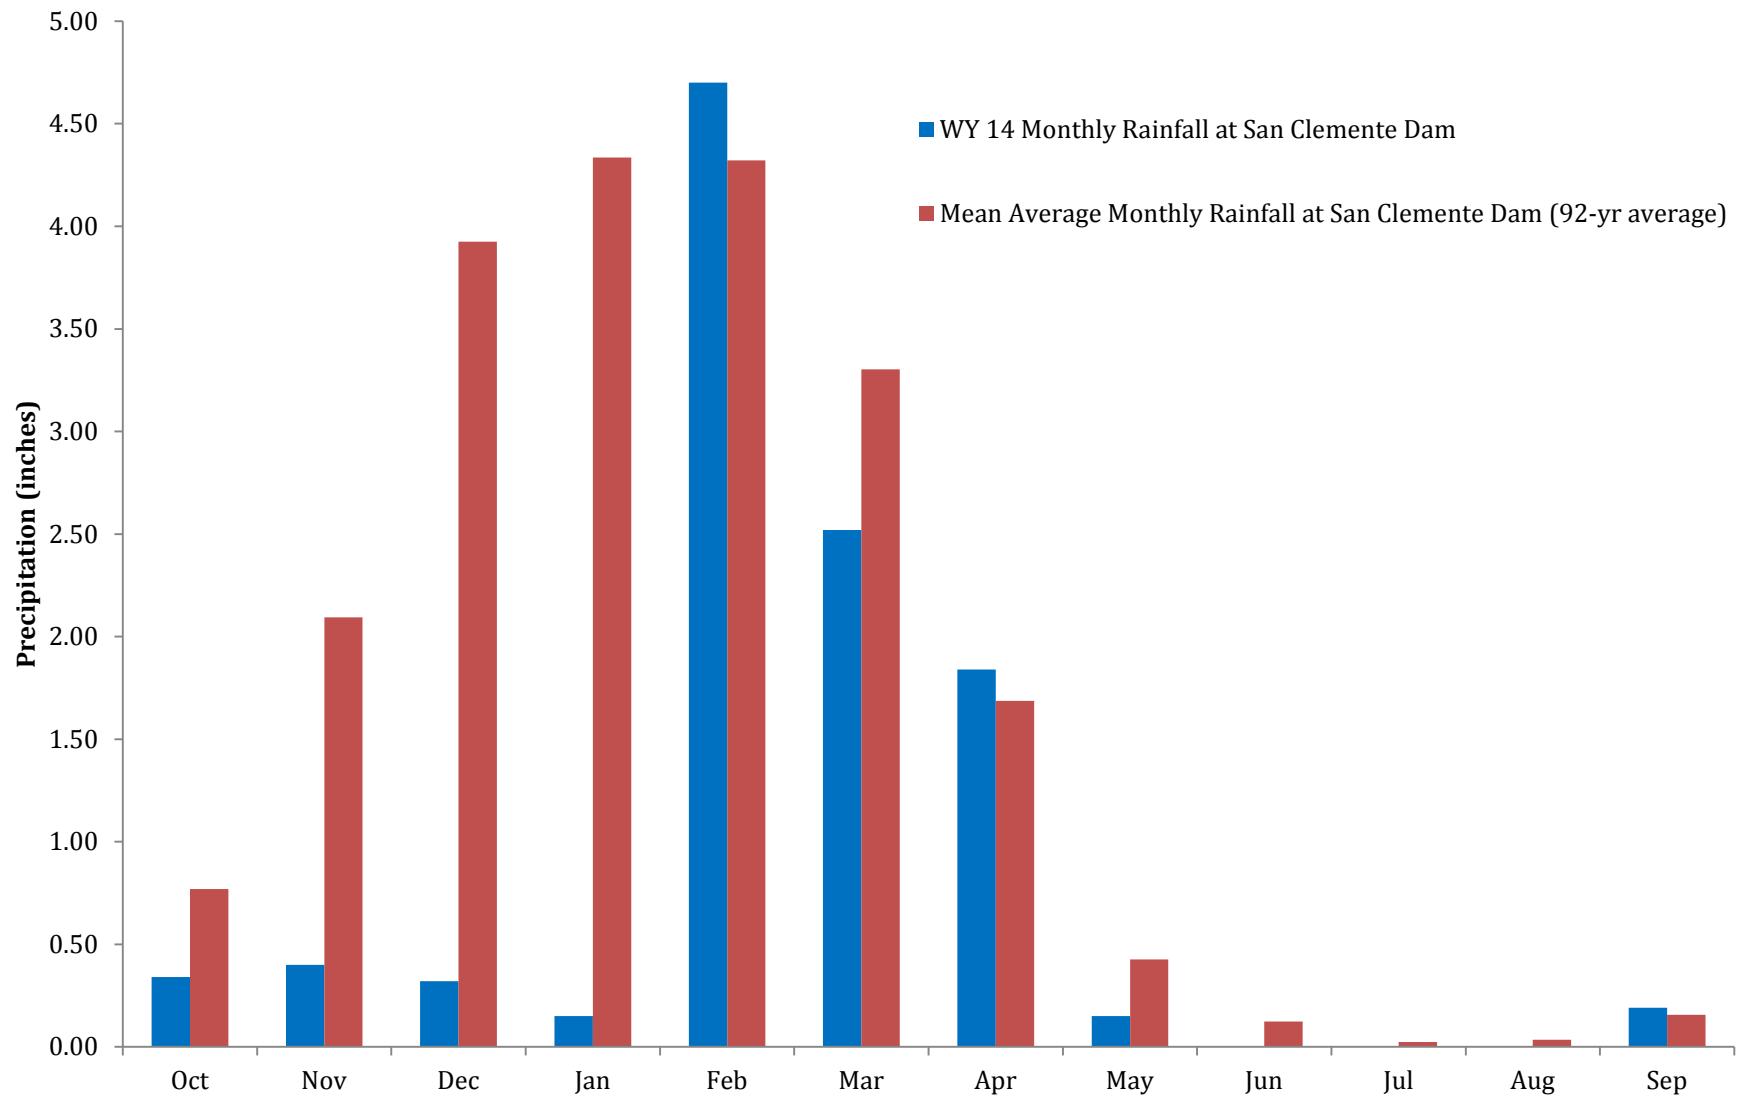

Figure 1. Monthly precipitation at San Clemente Dam for Water Year 2014. WY 2014 precipitation was below average. Total precipitation in WY 2014 at the dam was 10.61 inches compared to the average total precipitation at the dam, 21.20 inches. Mean monthly data is based on Water Years 1922 – 2014. Precipitation data are from the Monterey Peninsula Water Management District (2014).

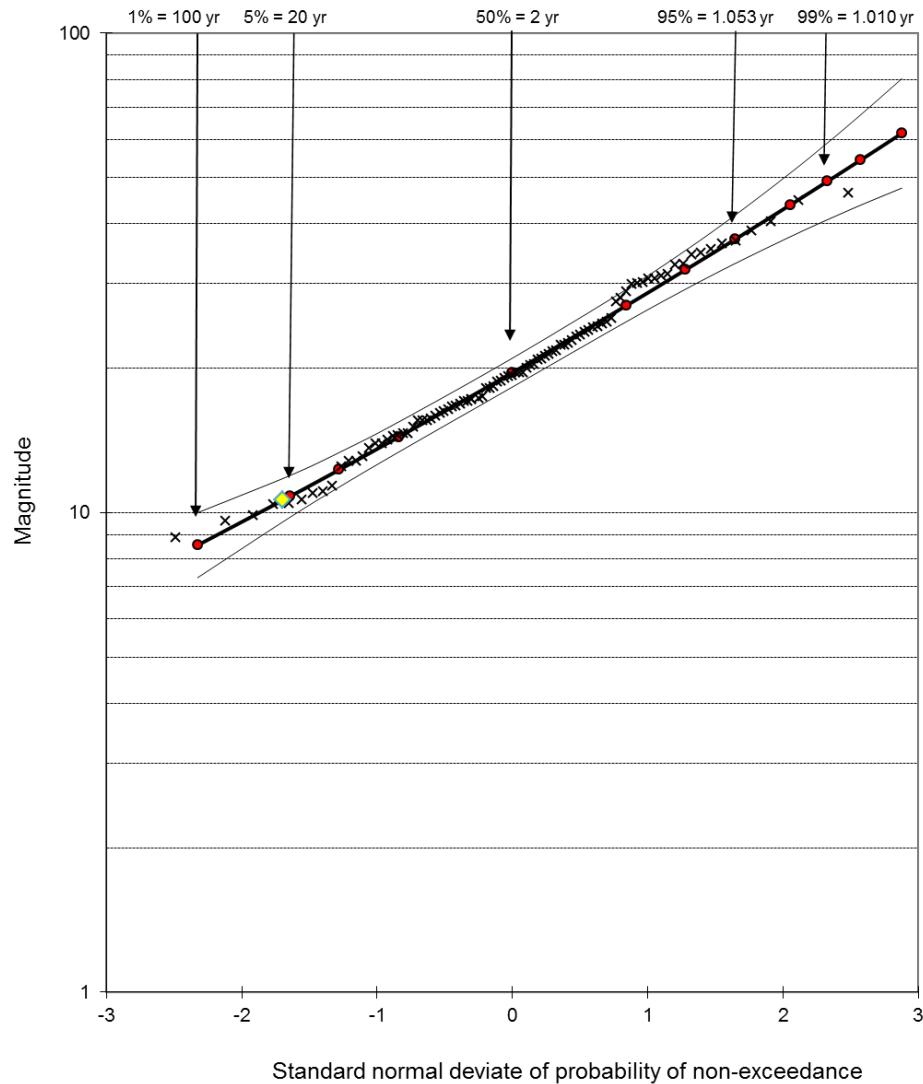

Figure 2. Log-Pearson Type-III statistical analysis of historic precipitation data from San Clemente Dam. Thin curved lines represent upper and lower 95% confidence bounds for precipitation and non-exceedance probability. The yellow diamond symbol marks the 10.61 inch precipitation of the 2014 water year.

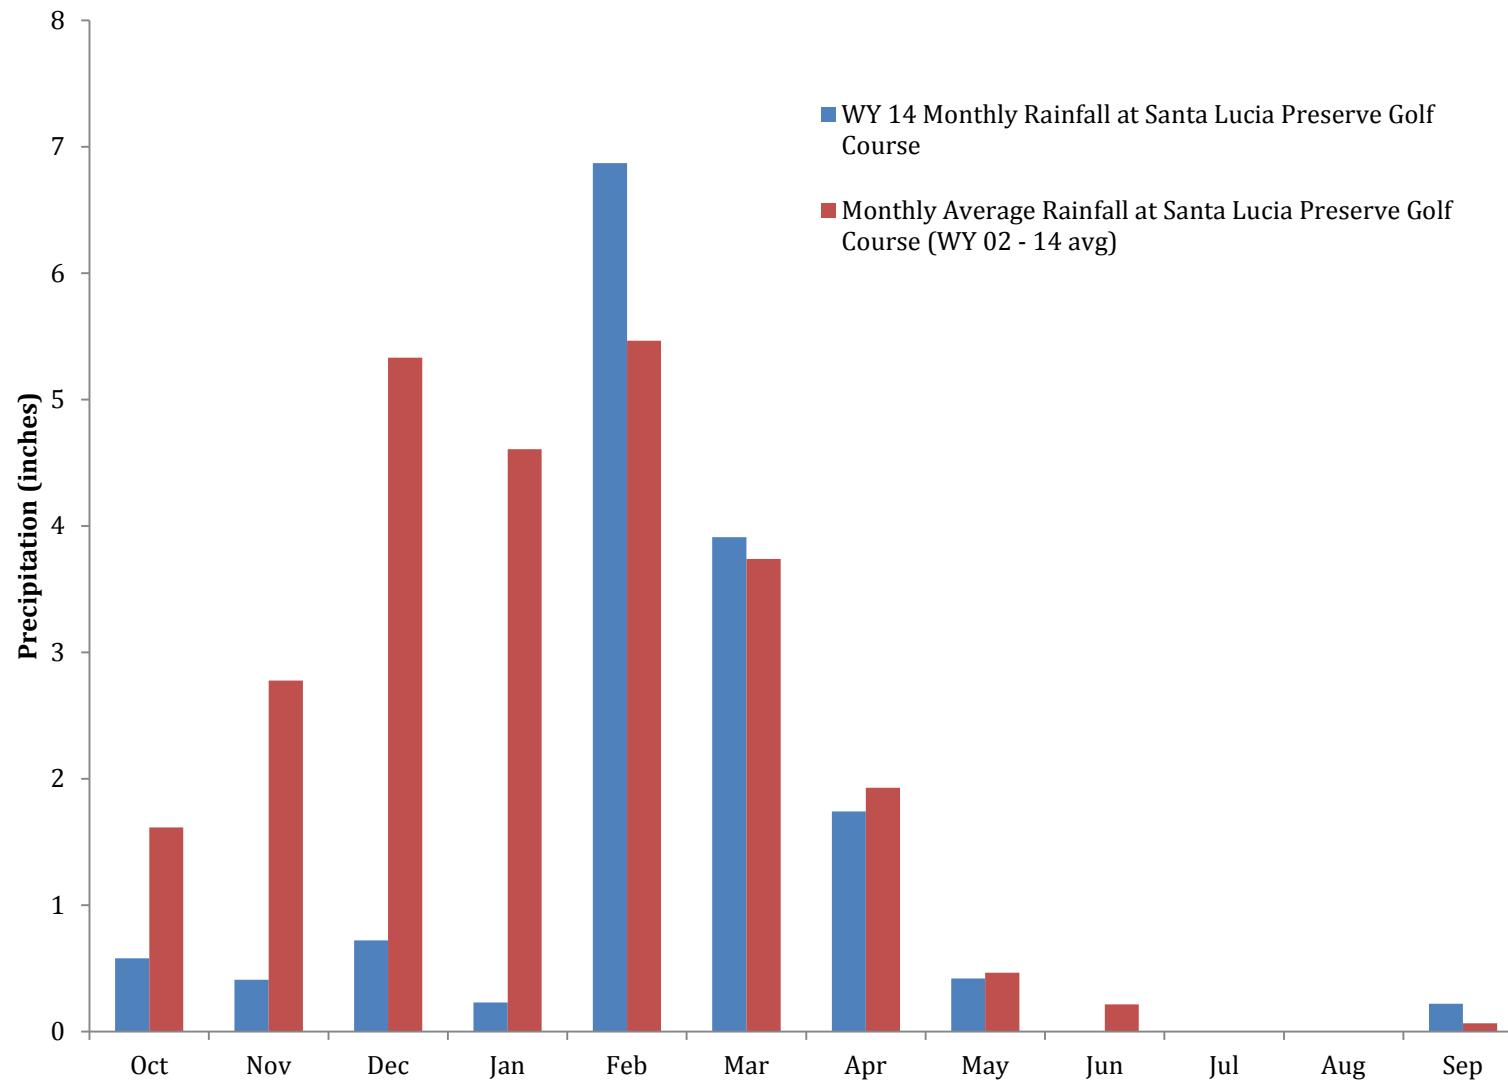

Figure 3. Monthly Precipitation at Santa Lucia Preserve Golf course for Water Year 2014. WY 2014 precipitation was below average at the golf course. Precipitation was 15.10 inches in Water Year 2014 compared to the 13 year annual average of 26.21 inches. Mean monthly average is based only on Water Years 2002 – 2014 and is probably not an accurate characterization of actual long-term patterns (precipitation data from Santa Lucia Preserve, 2014).

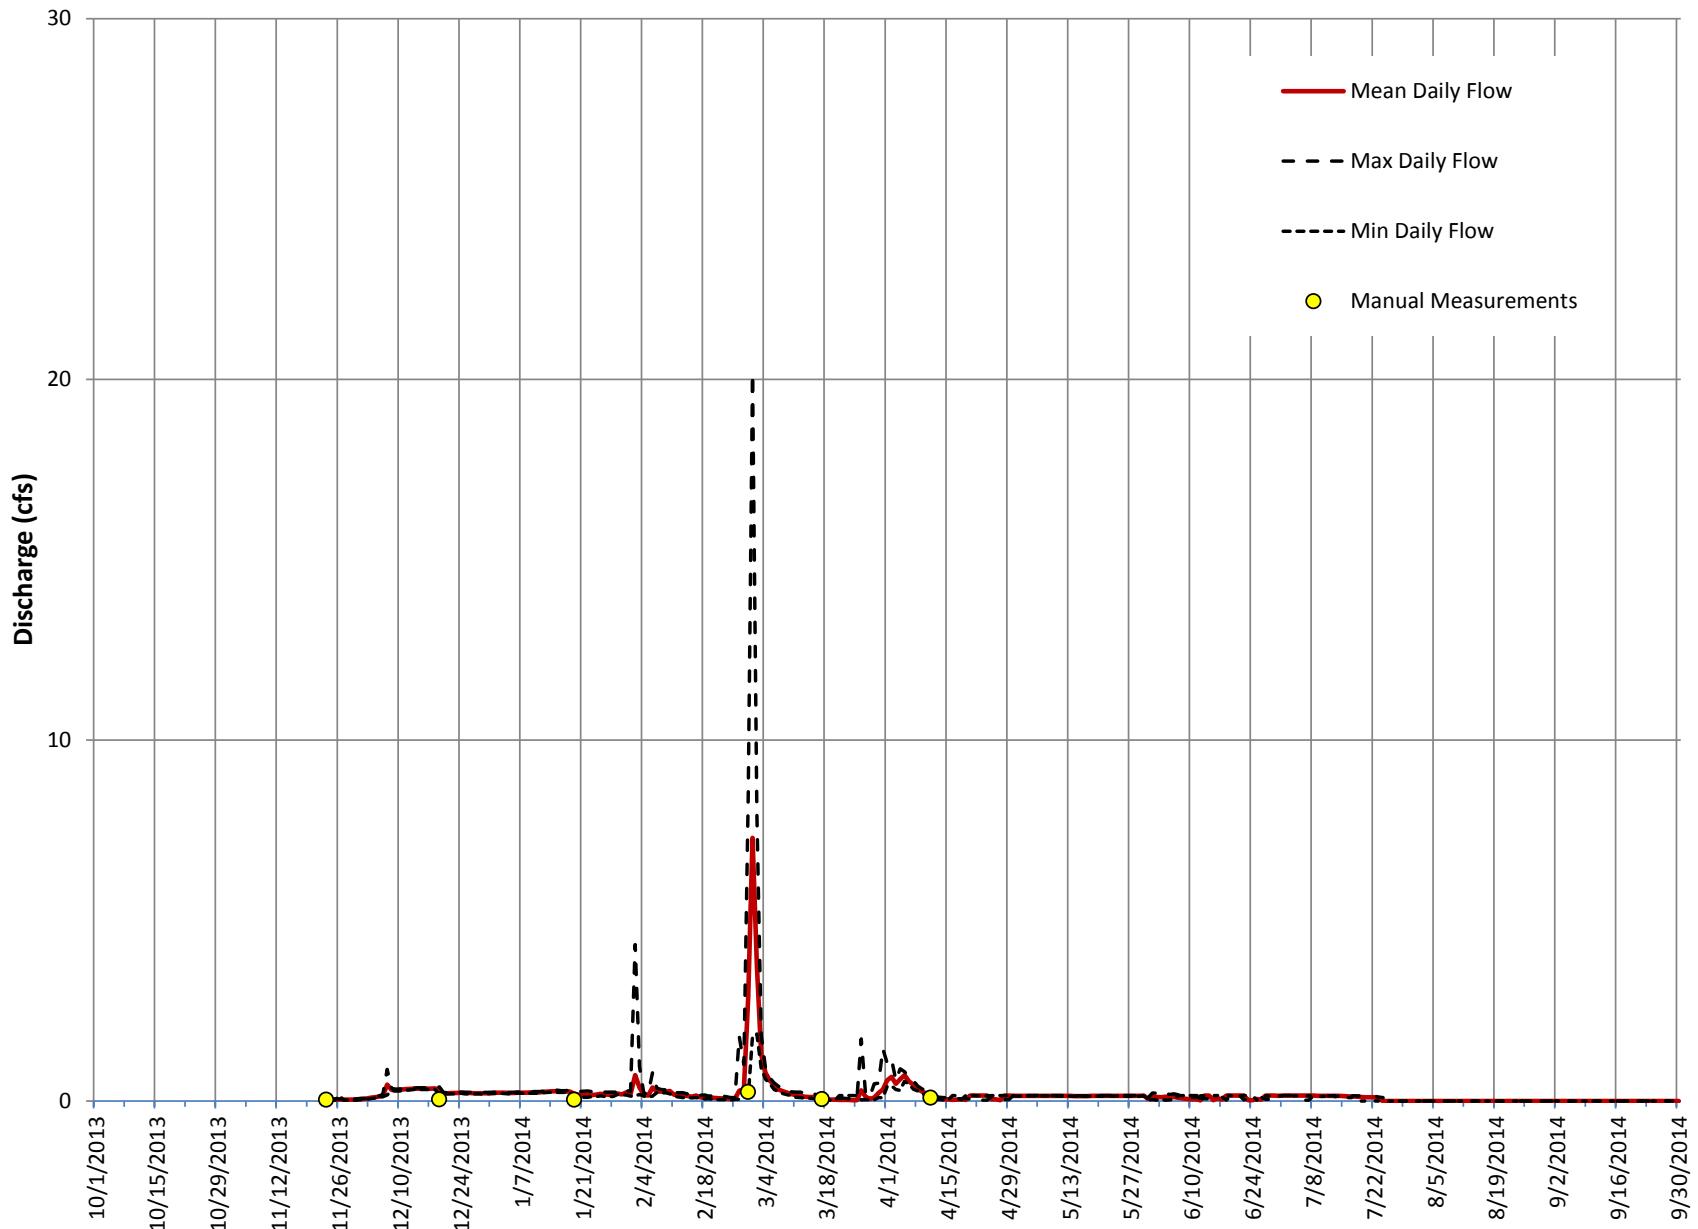

Figure 4. Mean Daily Streamflow at Potrero Creek gage for Water Year 2014. Red line is mean daily streamflow. Minimum and maximum daily flows are also shown. Yellow points represent manual discharge measurements.

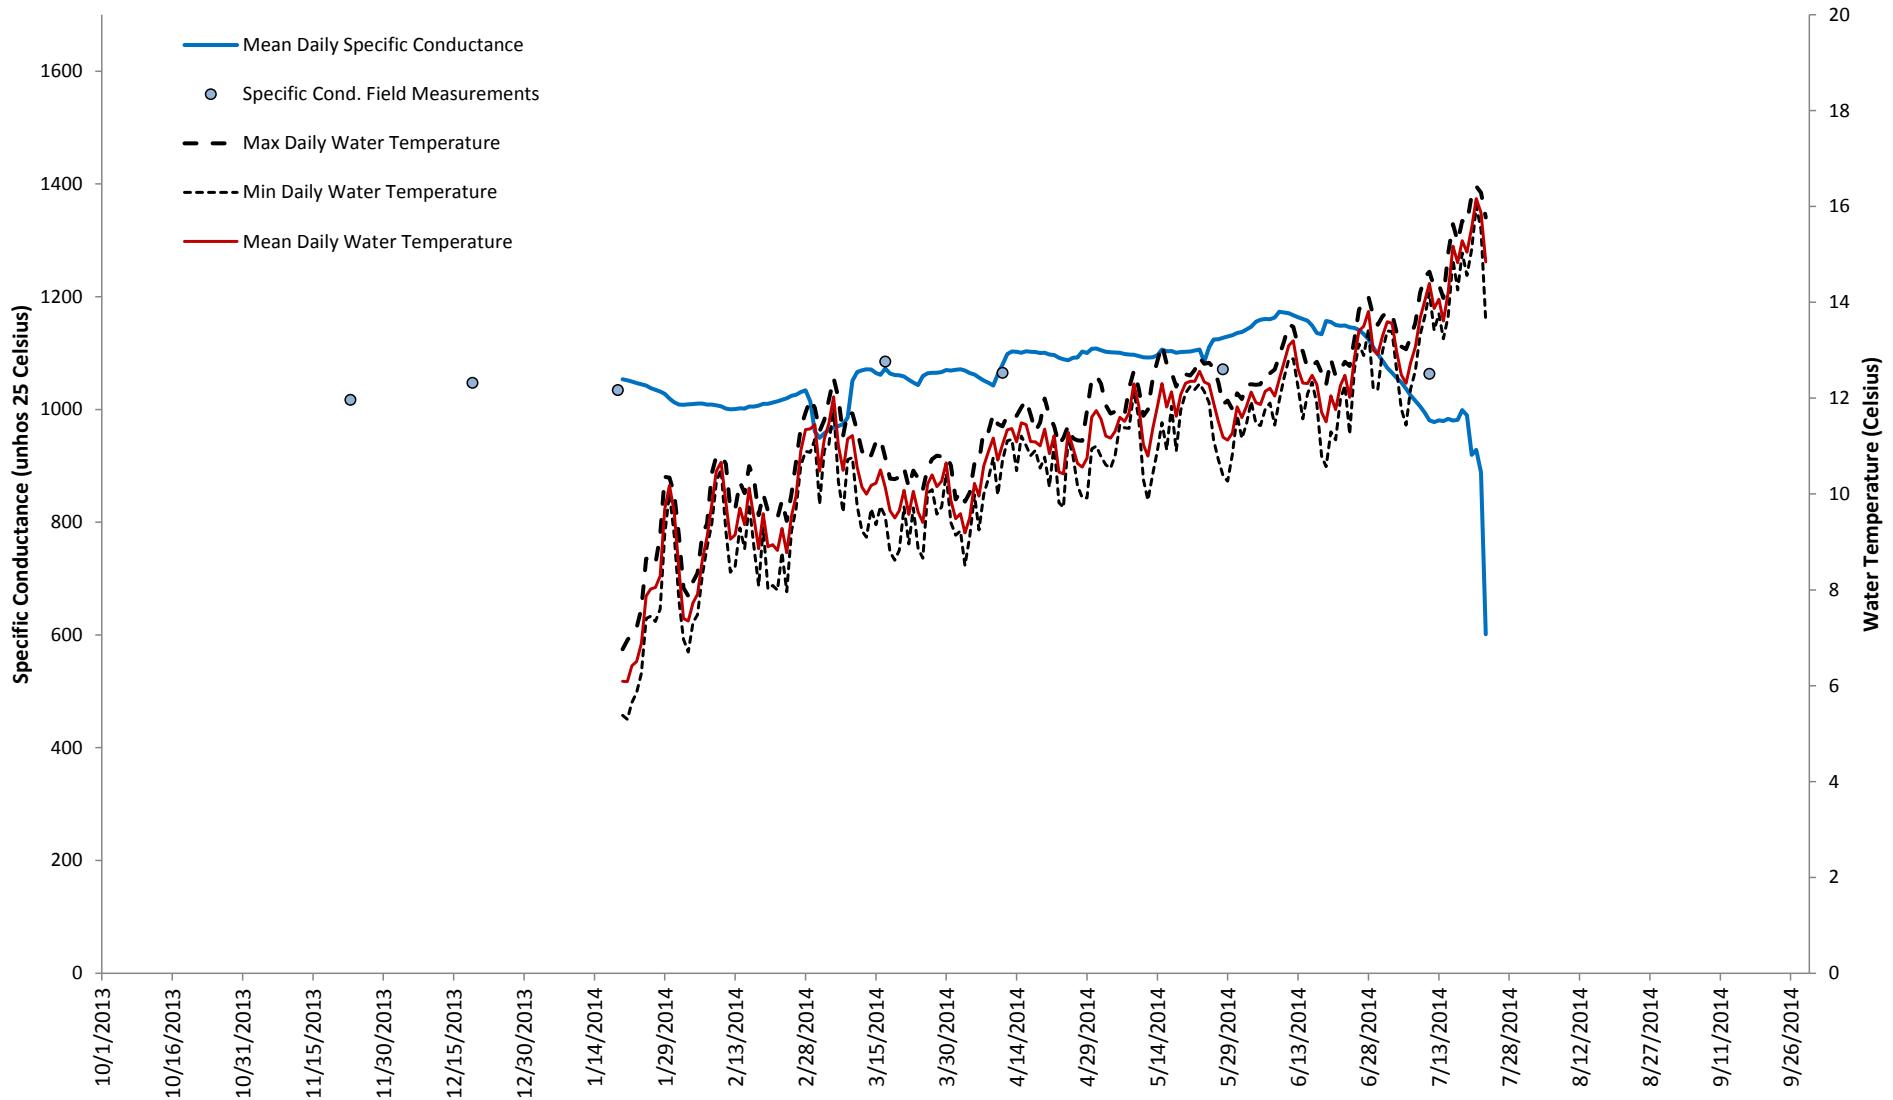

Figure 5. Daily Specific Conductance Water Temperature data at Potrero Creek gage for Water Year 2014.

Blue line is mean daily specific conductance; red line is mean daily water temperature; dotted lines represent minimum and maximum daily water temperature values.

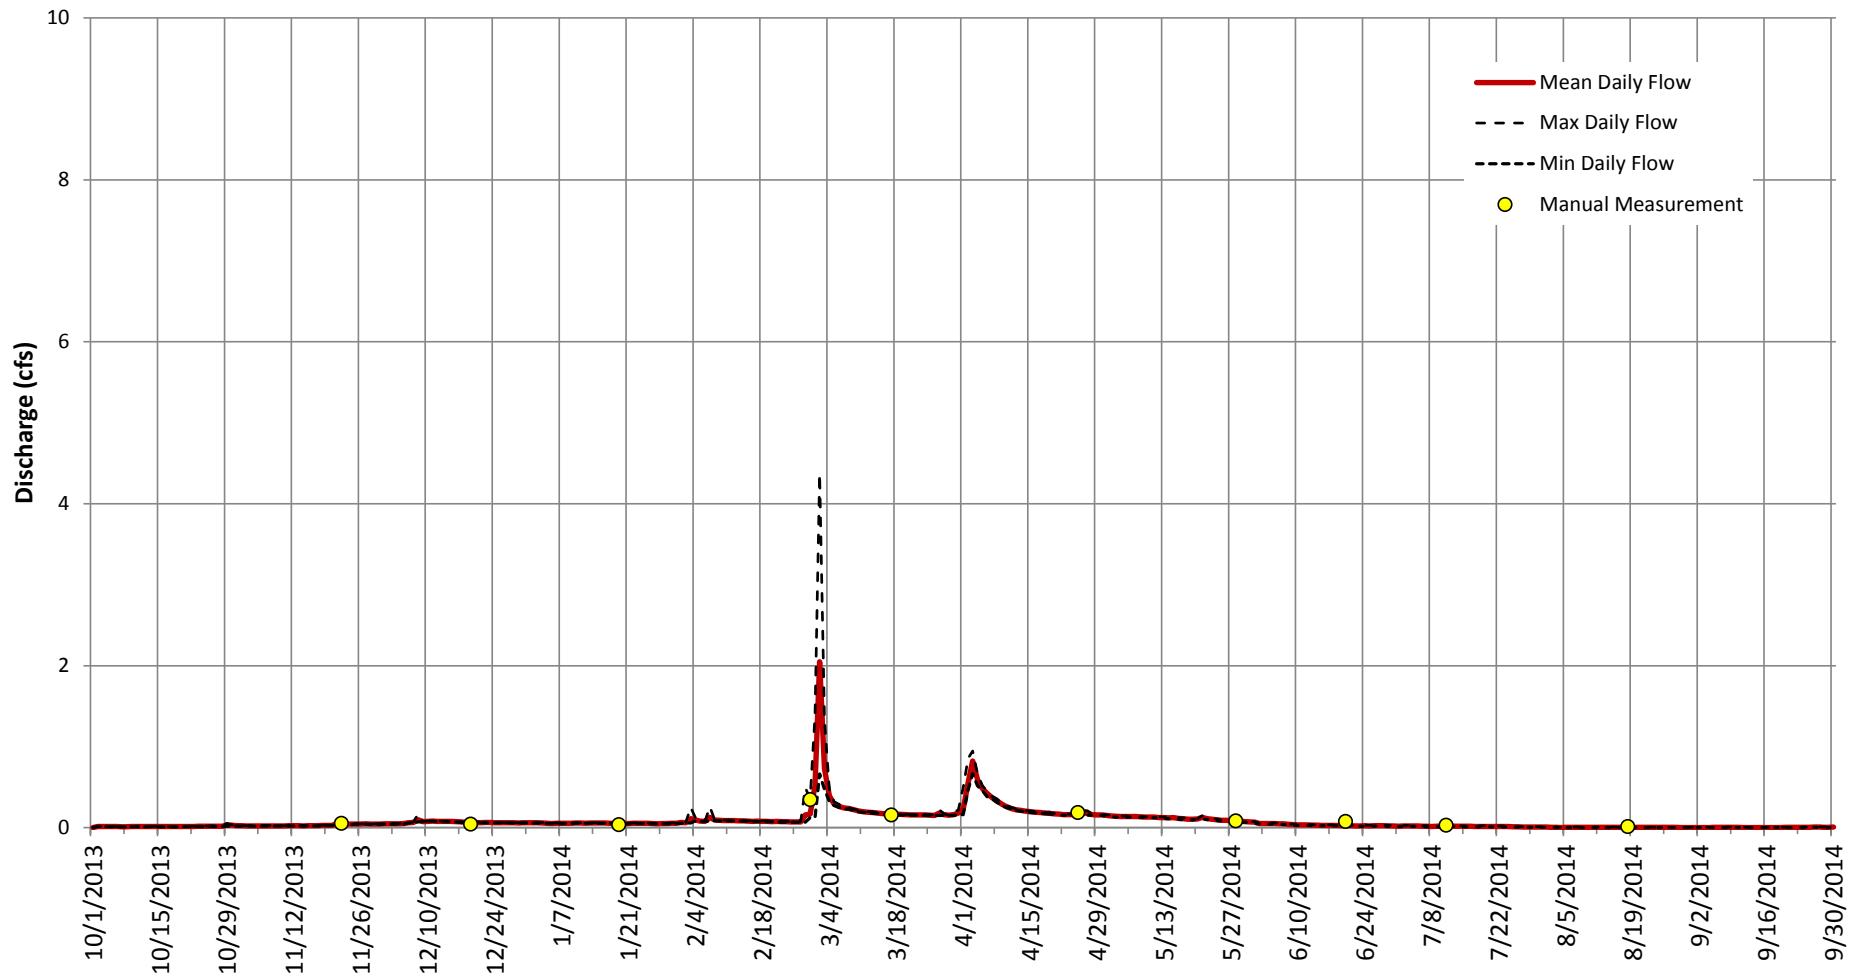

Figure 6. Mean Daily Streamflow at San Clemente Creek gage for Water Year 2014. Red line is mean daily streamflow. Minimum and maximum daily flows are also shown. Yellow points represent manual discharge measurements.

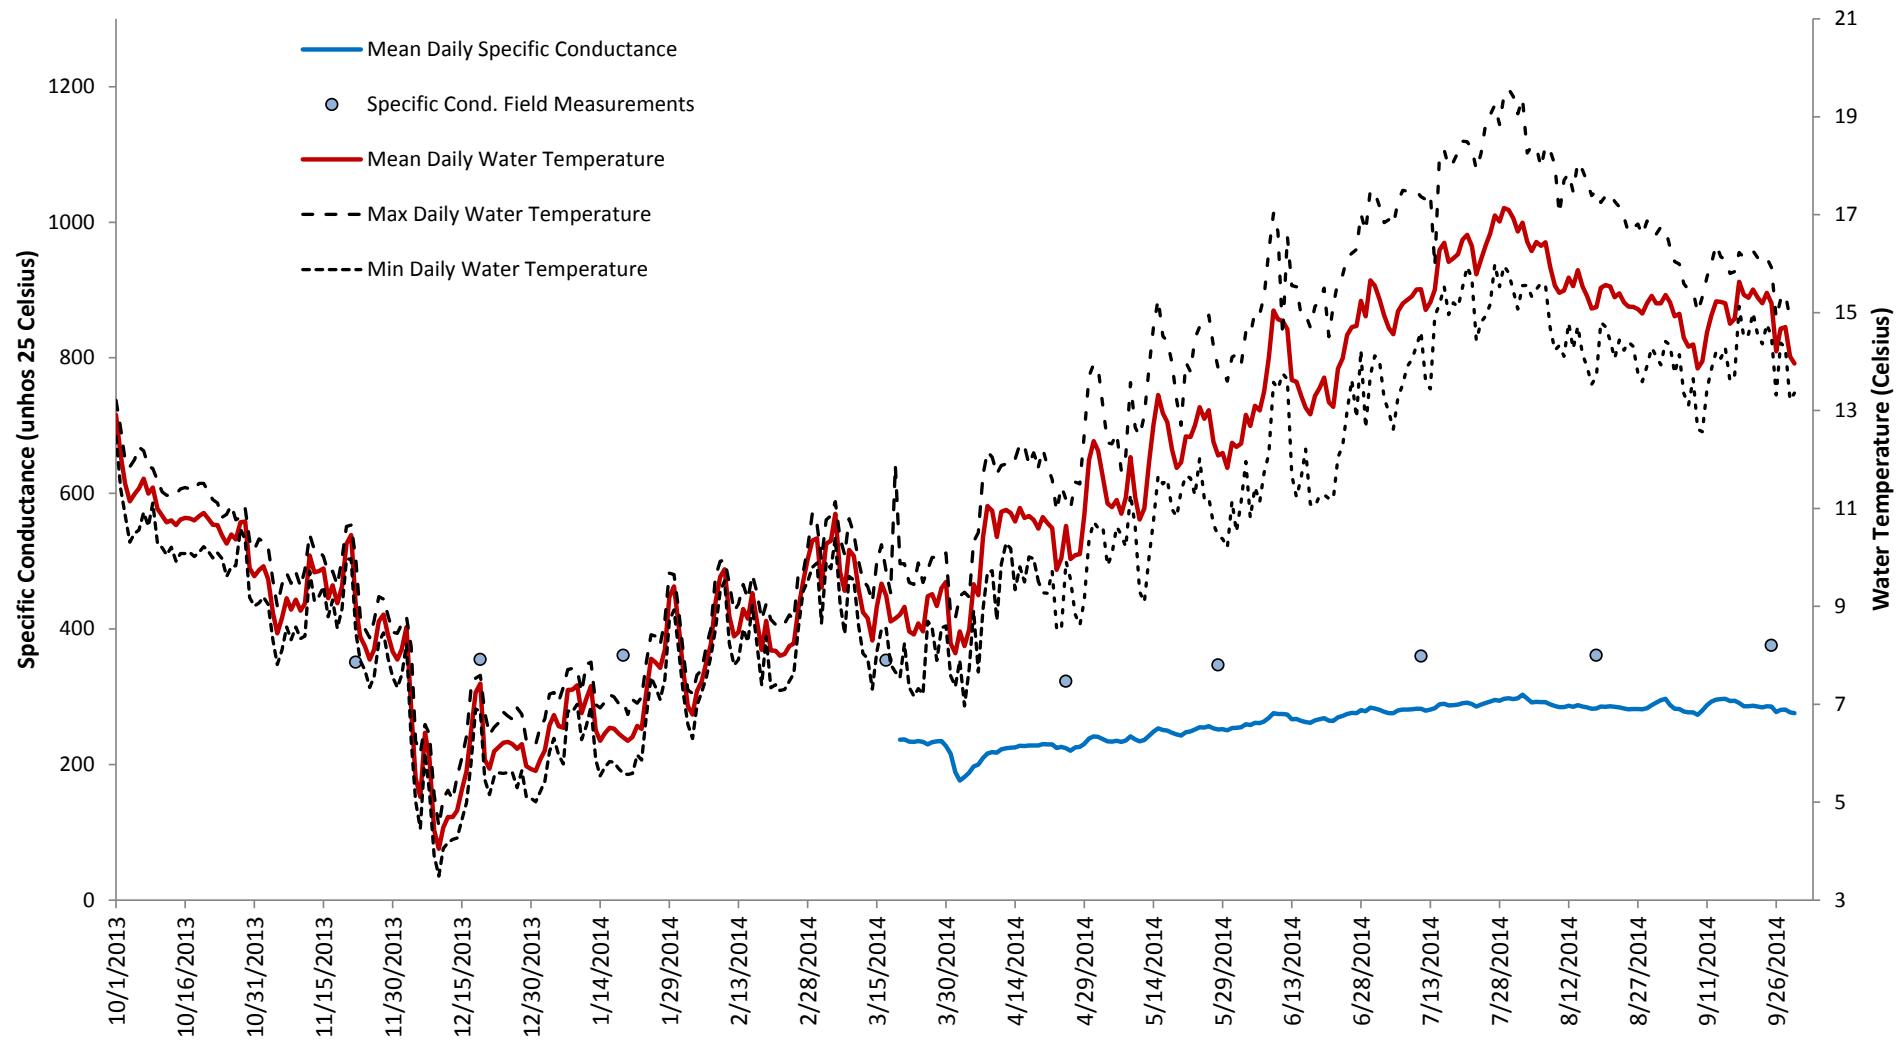

Figure 7. Daily Specific Conductance and Water Temperature data at San Clemente Creek gage for Water Year 2014. Blue line is mean daily specific conductance; red line is mean daily water temperature; dotted lines represent minimum and maximum daily water temperature values.
